Chirality Sum Rule in Graphene Multilayers

# Outline

---

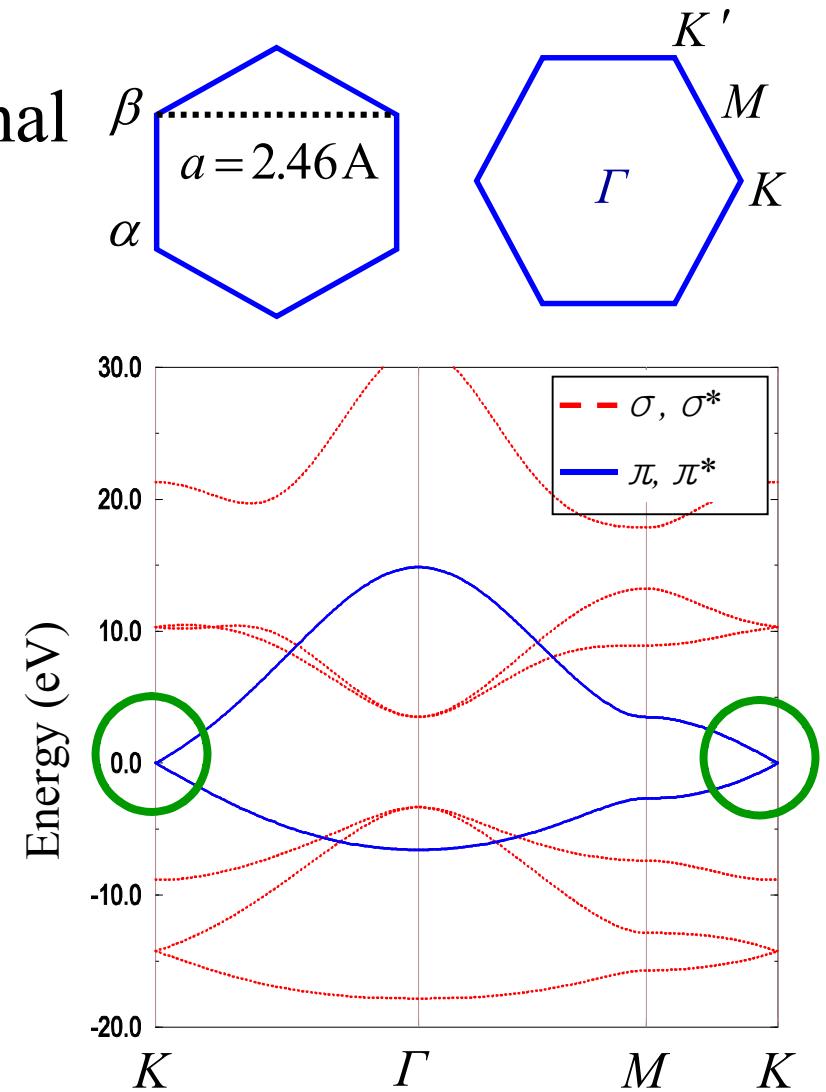

The low energy electronic structure of arbitrarily stacked graphene multilayers are described by a set of chiral 2D electron systems.

1. Monolayer Graphene
2. Multilayer Graphene
3. Chirality Sum Rule
4. Applications: Pseudospin Magnetism

# 1. Monolayer Graphene

## 1) Graphene

- Graphene is a two-dimensional honeycomb lattice of carbon atoms.
- At low energies near  $K/K'$ , energy bands are described by a 2D Dirac-like equation with linear dispersion.

Chirality Sum Rule in Graphene Multilayers

# 1. Monolayer Graphene

## 2) Effective theory

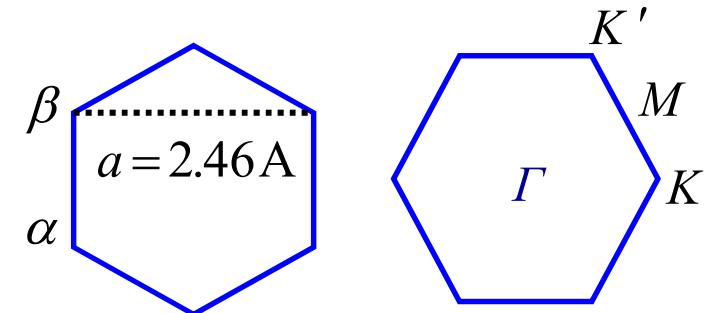

- At low energies near  $K$ , graphene is described by

$$H = v_F \begin{pmatrix} 0 & p e^{-i\phi_p} \\ p e^{i\phi_p} & 0 \end{pmatrix} = v_F p \boldsymbol{\sigma} \cdot \mathbf{n}$$

$$\boldsymbol{\sigma}_x = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \boldsymbol{\sigma}_y = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}$$

$$\mathbf{n}(\phi_p) = (\cos \phi_p, \sin \phi_p)$$

$v_F$  = in-plane velocity  
 $\phi_p$  =  $\tan^{-1}(p_y / p_x)$

$$E = \pm v_F p$$

$K$

- $\boldsymbol{\sigma}$  refers to sublattice  $\alpha$  and  $\beta$  instead of spin  $\uparrow$  and  $\downarrow$ .  
⇒ pseudospin

Chirality Sum Rule in Graphene Multilayers

# 1. Monolayer Graphene

## 3) Chirality

- Chirality is defined by a projection of spin ( $\sigma$ ) on the direction of motion ( $\mathbf{n}$ ).

$$H_J = \varepsilon_0 \begin{pmatrix} 0 & p^J e^{-iJ\phi_p} \\ p^J e^{iJ\phi_p} & 0 \end{pmatrix} = \varepsilon_0 p^J \boldsymbol{\sigma} \cdot \mathbf{n}_J(\phi_p)$$

$$\mathbf{n}_J(\phi_p) = (\cos J\phi_p, \sin J\phi_p)$$

$$\phi_p = \tan^{-1}(p_y / p_x)$$

- Energy spectrum is given by

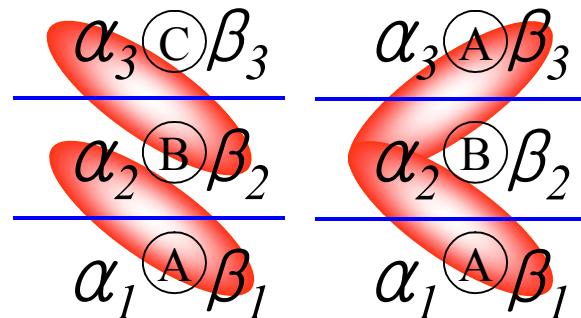

$$E_J(\mathbf{p}) = \pm \varepsilon_0 p^J$$

⇒ Monolayer graphene is described by  $J=1$  chiral 2D electron gas.

## 2. Multilayer Graphene

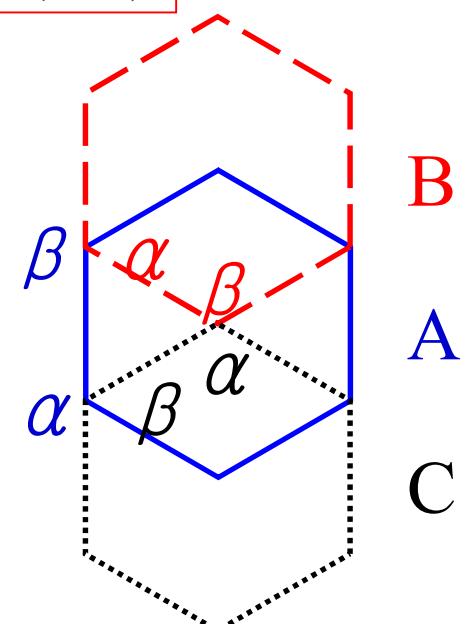

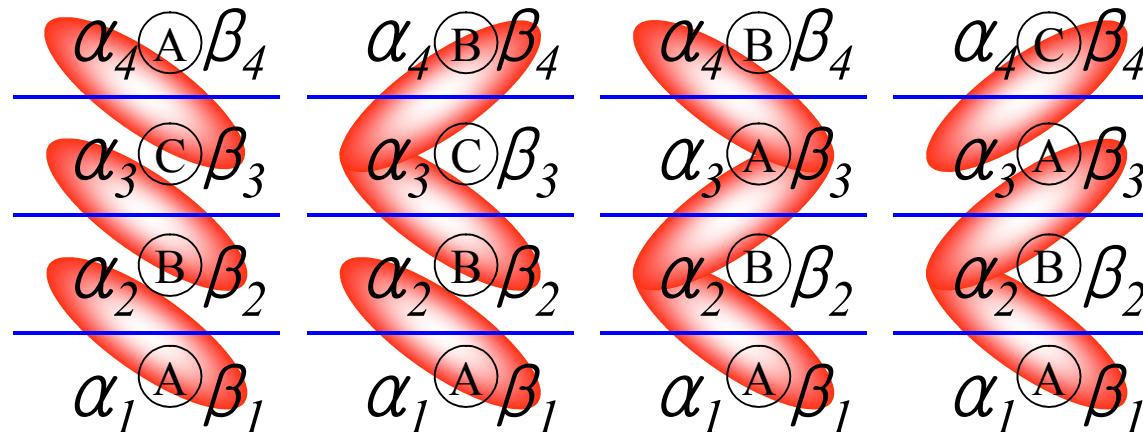

### 1) Stacking diagrams

- Layers are linked by vertical interlayer hopping

Ordered stacks:

Guinea et al., PRB **73**, 245426 (2006);  
Koshino et al., PRB **76**, 085425 (2007);  
Mañes et al., PRB **75**, 155424 (2007);  
Nakamura et al., PRB **77**, 045429 (2008).

Chirality Sum Rule in Graphene Multilayers

## 2. Multilayer Graphene

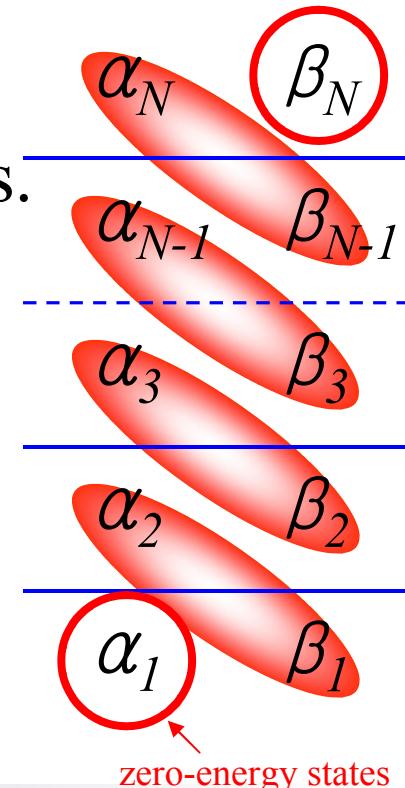

### 2) Effective theory

Min et al. PRB 77, 155416 (2008)

- Identify zero-energy states from the diagram.
- Obtain the effective theory using degenerate state perturbation theory.
- Example: ABC stacked  $N$ -layer  
Isolated  $\alpha_1$  and  $\beta_N$  are zero-energy states.

$$H_N^{ABC} = \epsilon_0 \begin{pmatrix} 0 & p^N e^{-iN\phi_p} \\ p^N e^{iN\phi_p} & 0 \end{pmatrix}$$

⇒ ABC stacked  $N$ -layer graphene is described by  $N$ -chiral 2D electron gas.

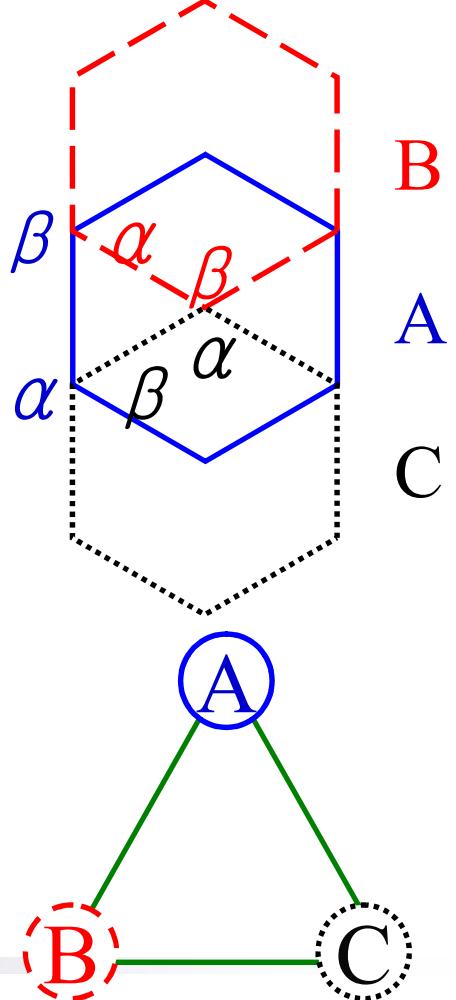

## 2. Multilayer Graphene

### 3) Example: N=3 and N=4 layers

Min et al. PRB 77, 155416 (2008)

- The system is decomposed to different chiral systems.

$\alpha_3 \circlearrowleft \beta_3$	$\alpha_3 \circlearrowright \beta_3$
$\alpha_2 \circlearrowleft \beta_2$	$\alpha_2 \circlearrowright \beta_2$
$\alpha_1 \circlearrowright \beta_1$	$\alpha_1 \circlearrowleft \beta_1$
<b><math>J=3</math></b>	<b><math>J=2+1</math></b>
$\alpha_4 \circlearrowright \beta_4$	$\alpha_4 \circlearrowleft \beta_4$
$\alpha_3 \circlearrowleft \beta_3$	$\alpha_3 \circlearrowright \beta_3$
$\alpha_2 \circlearrowleft \beta_2$	$\alpha_2 \circlearrowright \beta_2$
$\alpha_1 \circlearrowright \beta_1$	$\alpha_1 \circlearrowleft \beta_1$
<b><math>J=4</math></b>	<b><math>J=3+1</math></b>
$\alpha_4 \circlearrowleft \beta_4$	$\alpha_4 \circlearrowright \beta_4$
$\alpha_3 \circlearrowleft \beta_3$	$\alpha_3 \circlearrowright \beta_3$
$\alpha_2 \circlearrowleft \beta_2$	$\alpha_2 \circlearrowright \beta_2$
$\alpha_1 \circlearrowright \beta_1$	$\alpha_1 \circlearrowleft \beta_1$
<b><math>J=4</math></b>	<b><math>J=3+1</math></b>
$\alpha_4 \circlearrowleft \beta_4$	$\alpha_4 \circlearrowright \beta_4$
$\alpha_3 \circlearrowleft \beta_3$	$\alpha_3 \circlearrowright \beta_3$
$\alpha_2 \circlearrowleft \beta_2$	$\alpha_2 \circlearrowright \beta_2$
$\alpha_1 \circlearrowright \beta_1$	$\alpha_1 \circlearrowleft \beta_1$
<b><math>J=4</math></b>	<b><math>J=2+2</math></b>
$\alpha_4 \circlearrowleft \beta_4$	$\alpha_4 \circlearrowright \beta_4$
$\alpha_3 \circlearrowleft \beta_3$	$\alpha_3 \circlearrowright \beta_3$
$\alpha_2 \circlearrowleft \beta_2$	$\alpha_2 \circlearrowright \beta_2$
$\alpha_1 \circlearrowright \beta_1$	$\alpha_1 \circlearrowleft \beta_1$
<b><math>J=4</math></b>	<b><math>J=1+3</math></b>

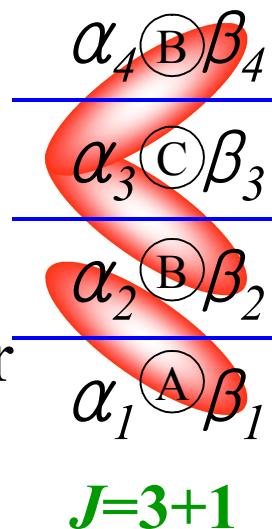

Chirality Sum Rule in Graphene Multilayers

## 2. Multilayer Graphene

### 4) Energy band structure

- Energy spectrum for  $J$ -chiral system

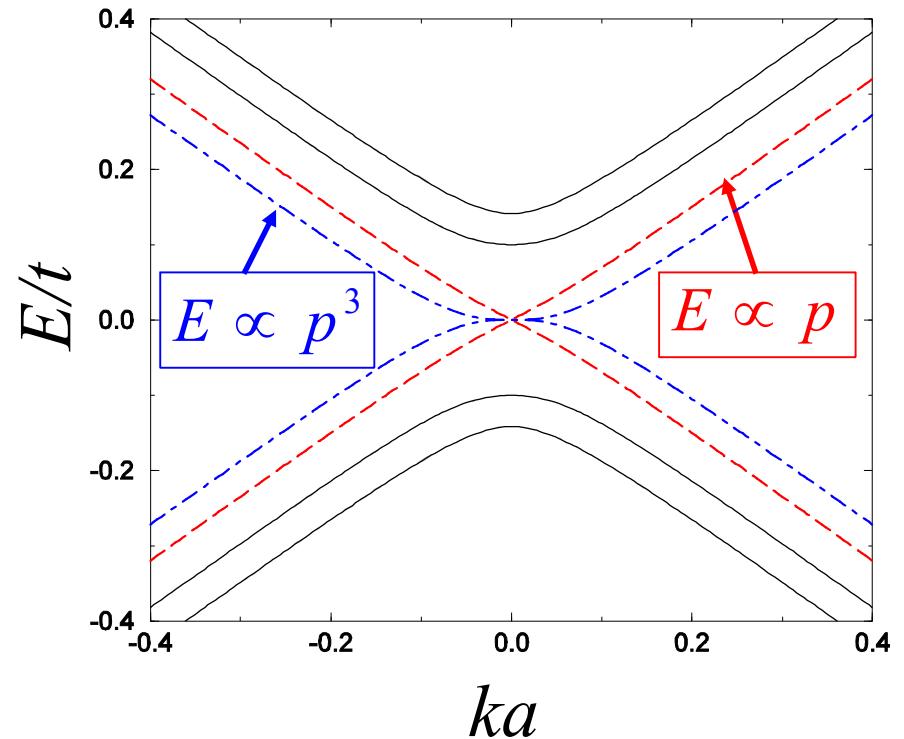

$$E_J(\mathbf{p}) \propto p^J$$

- Example:  
ABCB tetralayer

$$E_{ABCB}(\mathbf{p}) \propto p, p^3$$

Min et al. PRB 77, 155416 (2008)

⇒ ABCB tetralayer is described by a combination of  $J=3$  and  $J=1$  chiral 2D systems

### 3. Chirality Sum Rule

#### 1) Chirality sum rule

Min et al. PRB 77, 155416 (2008)

- $J$ -chiral system is described by

$$H_J = \varepsilon_0 p^J \boldsymbol{\sigma} \cdot \mathbf{n}_J(\phi_{\mathbf{p}})$$

$$\mathbf{n}_J(\phi_{\mathbf{p}}) = (\cos J\phi_{\mathbf{p}}, \sin J\phi_{\mathbf{p}})$$

- Arbitrarily stacked graphene multilayers are described by a set of chiral pseudospin doublets.

$$H_N^{eff} = H_{J_1} \otimes H_{J_2} \otimes \cdots \otimes H_{J_{N_D}}$$

$N_D$  = Number of doublets

- Although the number of doublets in an  $N$ -layer system depends on the stacking sequence, the pseudospin chirality sum is always  $N$ .

$$\sum_{i=1}^{N_D} J_i = N$$

### 3. Chirality Sum Rule

#### 2) Quantum Hall effect

Min et al. PRB 77, 155416 (2008)

- Chirality sum rule implies a new quantum Hall conductivity.

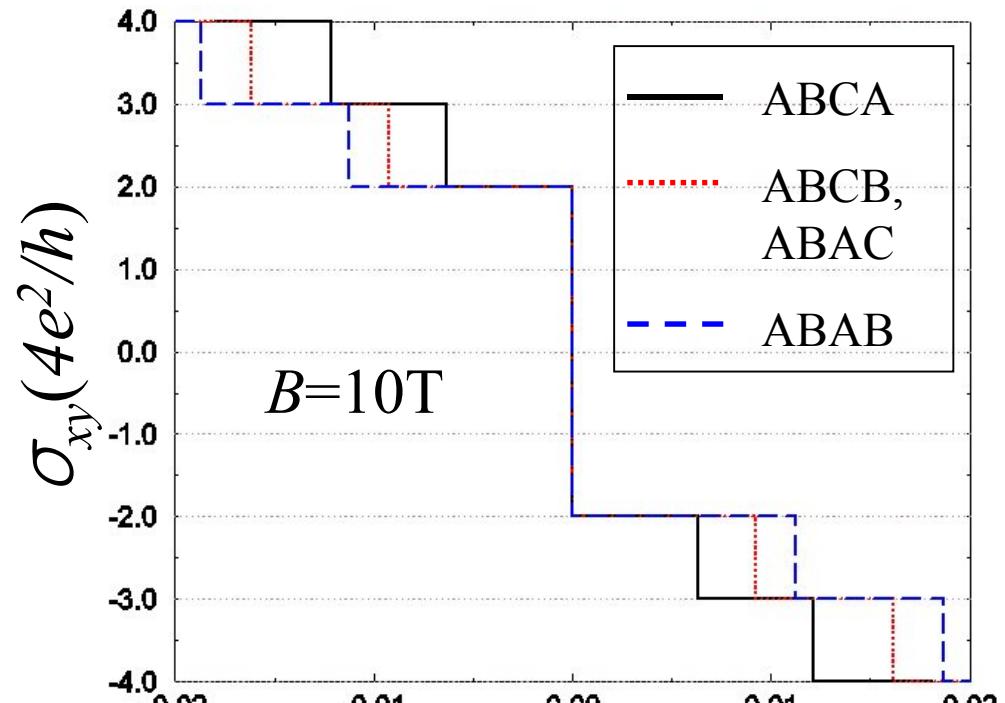

$$\sum_{i=1}^{N_D} J_i = N$$

$$\Rightarrow \sigma_{xy} = \pm \frac{4e^2}{h} \left( \frac{N}{2} + n \right)$$

$n=0,1,2,3,\dots$

- Example: Tetralayer

$\Rightarrow N=4$  quantum Hall conductivity

$E_F/t$

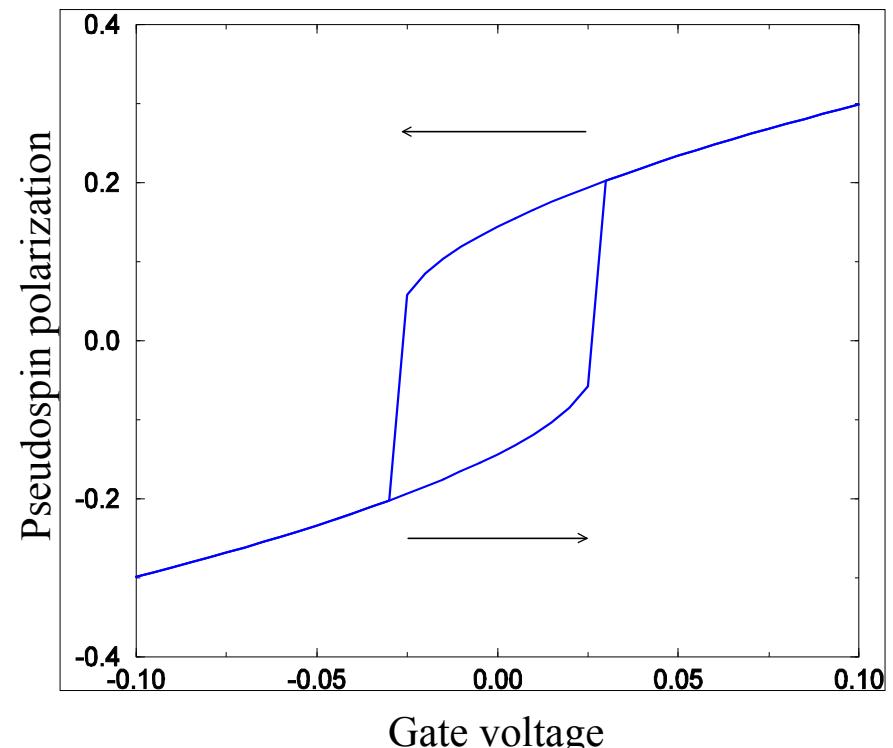

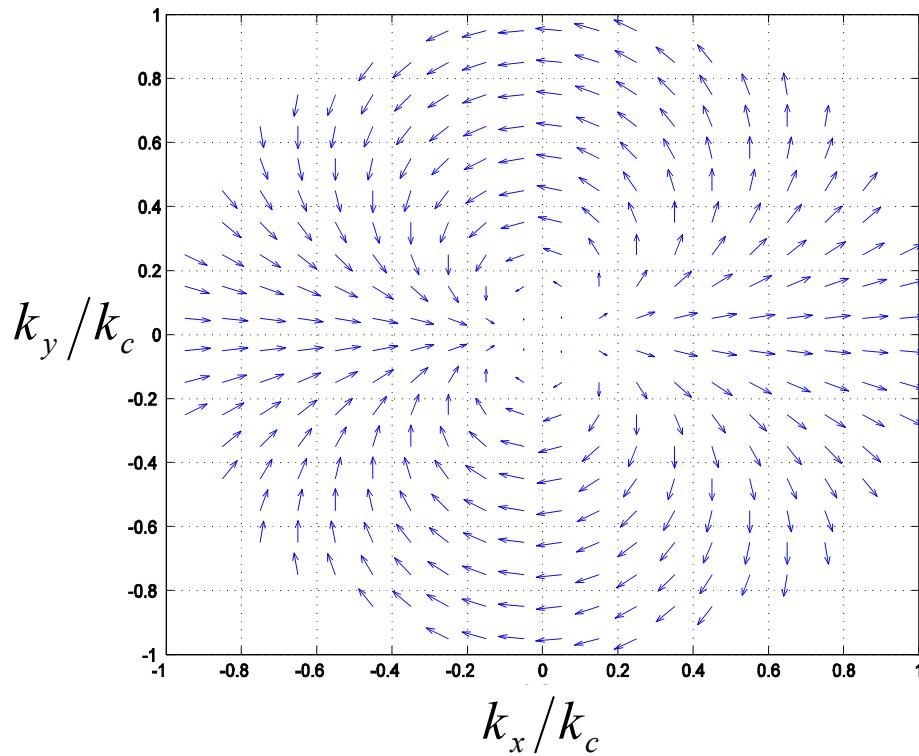

$E_F$  = Fermi energy  
 $t$  = intralayer hopping

Chirality Sum Rule in Graphene Multilayers

## 4. Applications: Pseudospin Magnetism

### 1) Example: Bilayer graphene ( $J=2$ )

Min et al. PRB 77, 041407(R) (2008)

$$H_J = \epsilon_0 p^J \boldsymbol{\sigma} \cdot \mathbf{n}_J(\phi_p)$$

$$\mathbf{n}_J(\phi_p) = (n_{\perp} \cos J\phi_p, n_{\perp} \sin J\phi_p, n_z)$$

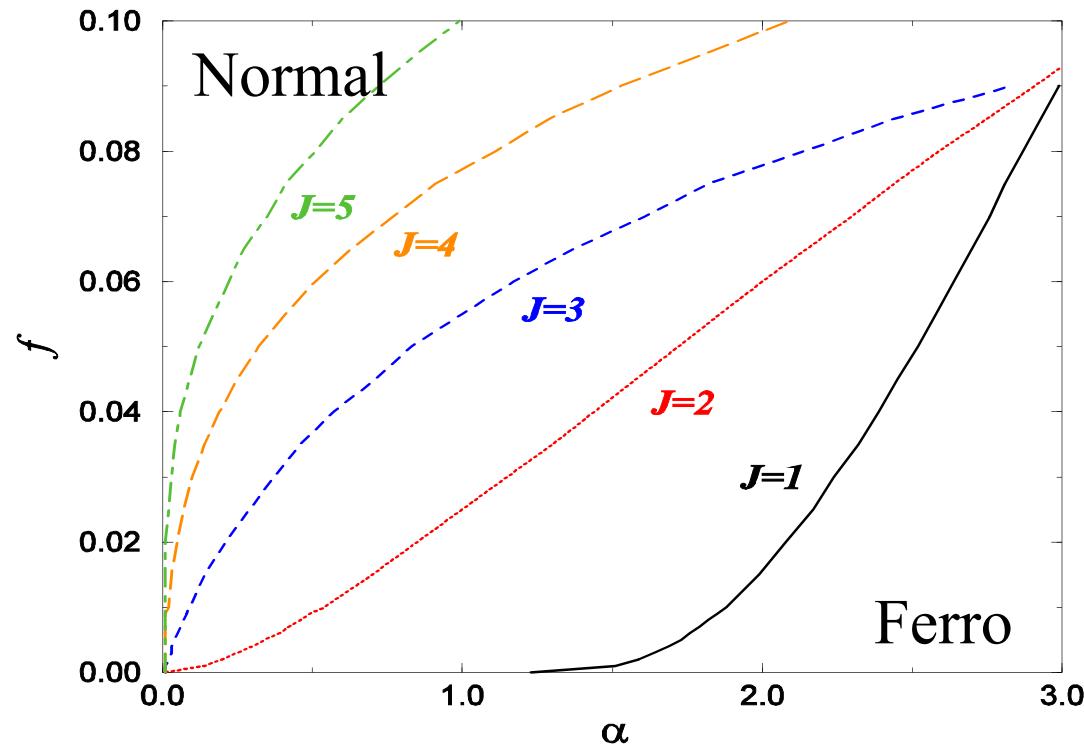

⇒ The charge density spontaneously shifts to one of the two layers.

Chirality Sum Rule in Graphene Multilayers

## 4. Applications: Pseudospin Magnetism

### 2) Phase diagram

Min et al. PRB 77, 041407(R) (2008)

$J$  : chirality  
 $\alpha$  : interaction strength  
 $f$  : doping

- Pseudospin magnetism is stable for stronger interaction strength, for smaller doping, for larger chirality.
- ABC stacked multilayers are excellent candidates.

# Summary

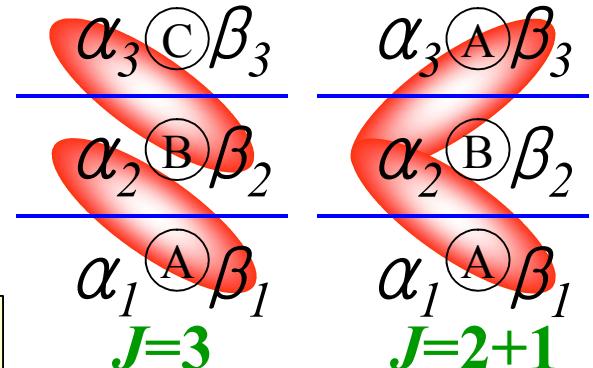

## 1) Chirality sum rule

- Arbitrarily stacked graphene multilayers are described by a set of chiral systems.

$$H_N^{eff} = H_{J_1} \otimes H_{J_2} \otimes \cdots \otimes H_{J_{N_D}}$$

$$\sum_{i=1}^{N_D} J_i = N$$

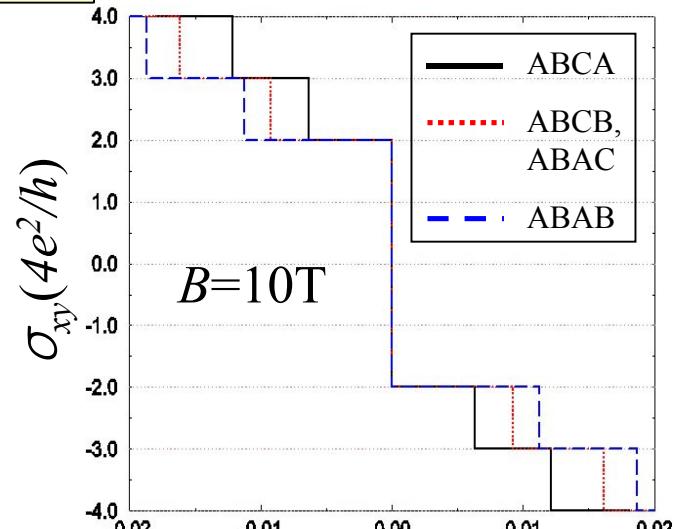

Min et al. PRB 77, 155416 (2008)

## 2) Quantum Hall effect

- Chirality sum rule implies a new quantum Hall conductivity.

$$\sigma_{xy} = \pm \frac{4e^2}{h} \left( \frac{N}{2} + n \right) \quad n=0,1,2,3,\dots$$
